

Electronic Visit Verification - EVV

Powered by: **Mobility eXchange**

Mobility Exchange offers a comprehensive solution that monitors, reports, and authenticates patient and caregiver's unique identity; verifies it with the correct location, appropriate time, and precise plan of care.

Our Electronic Visit Verification (EVV) solution is compliant with the CURES ACT and is reimbursable by the United States government for its design, implementation and operational costs.

How it works:

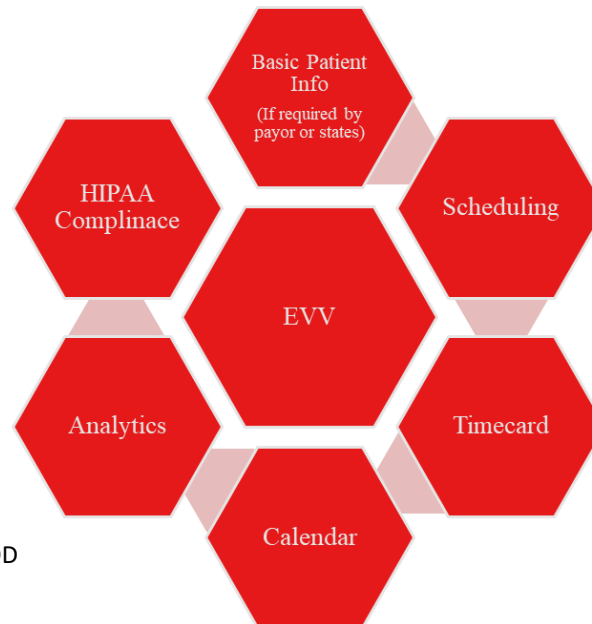

An **auditable record** is created of each transaction with **proof of presence**, including a time and date stamp. This record can be utilized for billing, timecards, scheduling and tracking purposes and is available 24/7.

The system can **calculate caregiver mileage** in order to eliminate "no shows" on the caregiver's part and **sends a supervisor alert accordingly**.

All EVV programs include **setup, deployment** and ongoing **training**.

What's included:

- A secured environment for **HIPAA-compliant** tools (BYOD or devices deployed by Mobility eXchange)
- EVV application and setup
- Training and continual support

Optional additions:

- Locked down device and network
- Customizable device management portal
- Protection from device damage with MobilityCare

Reimbursable:

The CURES Act specifies that the government will **reimburse up to 90% of costs** associated with the design, development and/or installation of an EVV system, along with up to 75% of operation and maintenance expenditures.

Benefits:

- **Greater operational efficiency** through automated scheduling and time tracking
- **Fraud Prevention** through validation and authentication of the service provider
- Improvement in **quality of care** with **reporting** and documenting service for the patient
- **Administrative costs lowered** by accurately tracking service provider schedules and billing submissions
- **Analytics** to help refine services and deliver the proper care
